

Population Ecology

I. Introduction (Chap. 9)

A. Examples: The scope of population ecology

B. Definitions and properties

Terms: population, distribution, abundance, density, age structure, growth rate, demographics

II. Growth rates: intrinsic rates of increase (Ch. 11)

A. Geometric growth

B. Exponential growth

C. Survivorship and fecundity curves

Definitions

Population: a group of individuals of the same species occupying a particular space at the same time.

Climatic Effects on Columbia River Chinook

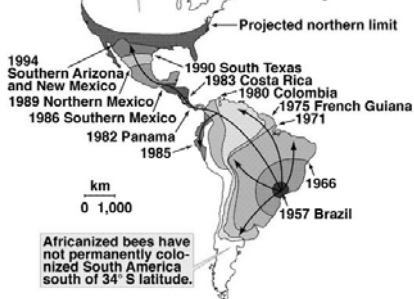

Taylor and Southard, 1997. http://www.ocs.orst.edu/reports/climate_fish.html

Cheatgrass (*Bromus tectorum*)

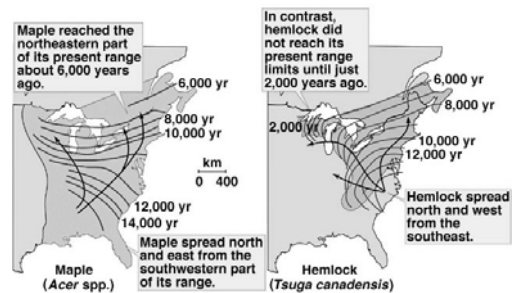

A. Whitham, 2003. <http://environmentalstudies.wlu.edu/Capstone%202003/Images/Capstone%202003%20Agricultural%20Invaders.htm>

Africanized Bee Expansion

Northward Tree Expansion

Chapter 9. Focus on the following questions:

1. What factors limit the distribution of a population of organisms?
2. What is the difference between a fundamental and a realized niche?
3. What do patterns of distribution (random vs. regular vs. clumped) tell us about the ecology of individuals in that population?
4. How does organism size influence population density (number of individuals in a given area)?
5. What are the seven different ways that organisms can be rare? How does this influence their susceptibility to extinction?
